Did you know the National Institutes of Health has *proven* that exposure to wireless radiation causes cancer? Probably not.

With billions of dollars at stake, it’s not surprising that the wireless industry has spent millions making sure that Americans don’t know about (or don’t believe) the ground-breaking study, requested by the Food and Drug Administration and carried out by the National Toxicology Program of the National Institutes of Health. The purpose of the study was to determine whether or not non-ionizing radiation emitted by cell phones, tablets, wireless antennas, smart meters and other wireless devices could cause cancer in humans.

*The wireless industry initially supported the study, assuming it would prove what they had been claiming for almost forty years: non-ionizing radiation cannot cause cancer.*

So you can imagine the panic that ensued within the industry when the initial results of the multi-year, $30 million dollar study were announced in 2016. The study found a clear and unmistakable increase in cancer among the lab animals tested, the same animals we use to test the safety of pharmaceuticals.

Then in 2018, a panel of independent experts was convened to review the study. Their conclusion: it’s worse than we thought. Not only can the exposure cause cancer, but it can also damage DNA and the heart.

*The wireless industry’s response?* It’s the tobacco industry playbook: keep insisting that wireless radiation is completely safe, and try to discredit the findings of the most extensive and carefully controlled study ever conducted by the most prestigious health research organization in the world, which corroborated hundreds of independent studies that preceded it.

The industry makes jokes about folks in tin-foil hats, but for the sake of our kids it’s time to acknowledge the proven scientific fact: wireless radiation causes cancer and DNA damage. Anyone who claims it doesn’t is either misinformed or intentionally misleading people.
